

Finishes

Below is a detailed explanation of our corbel, linear shelf bracket and iron support leg finishes.

Black – After pre-treatment, we powder-coat the product in a matte black. This is a true black, with next to zero sheen.

Old World – After pre-treatment, we powder-coat it in a matte black. Once the powder has baked and cooled, we then lightly dry-brush over the black with a dark chocolate brown paint.

Oil Rubbed Bronze – After pre-treatment, we powder coat it in a matte black. Once the powder has baked and cooled, we then lightly dry-brush over the black with a dark copper metallic paint. This finish is one of our most popular finishes, if you're looking to match your other oil rubbed bronze hardware in the home, this is the finish to choose.

Antique Pewter – After pre-treatment, we dry brush a flat black over a good portion of the product. We then finish it off with a matte clear powder-coat. This finish shows a little of the silver grinder marks, but not a whole lot. It's a pretty even mixture of grays and streaks of black.

Greystone - After pre-treatment, we lightly dry-brush a light gray over a good portion of the product, then we matte clear powder-coat for the last step. Aside from the silver grinder marks, this finish shows some of the raw mill finish from the steel, which is a charcoal gray color. So it's a mix silver grinder marks, charcoal grey and light grey brush strokes.

Unfinished with clear powder-coat – After grinding and sanding, we finish it off with a matte clear powder-coat. This finish does a really good job of showing what raw steel looks like with a mixture of grinder marks and the charcoal gray mill finish that comes on the steel. If you're looking to compliment brushed nickel hardware or stainless steel, this is the finish to choose.

Unfinished ready for paint – After fabrication, sanding etc..., we clean the product and then ship it to you to paint yourself. Note: If you don't paint or seal the product, it will have potential to rust due to moisture in the air.

Outdoor Use: Our products are powder-coated, so they will last a good while outdoors, but like all steel products, sooner or later they will show signs of rust in areas that hold water. This is not to say that you cannot use them outdoors. Consider steel patio furniture, they're in the sun, rain, snow etc... for years before showing any signs of rust. Keep in mind, if you install our products underneath a counter or roof overhang outdoors, our products should last for many years without concern.
